

Dhwani Agrawal . Jarvis Consulting

I am a detail-oriented business and data professional with over three years of experience working closely with IT and business teams in a manufacturing environment. I enjoy understanding how systems work and solving problems by turning business requirements into practical technical solutions. I have hands-on experience with SQL, Linux, shell scripting, and data analysis. During my time at Jarvis Consulting, I worked on real-world data engineering projects, including building a Linux-based system monitoring application using Bash, PostgreSQL, and Docker. I am genuinely interested in data, automation, and improving systems, and I am currently looking for entry-level Data Engineer or Systems Analyst roles where I can keep learning and make a meaningful contribution.

Skills

Proficient: Requirement Gathering, Functional and Non-Functional Specs, Process Analysis, Agile/Scrum, Stakeholder Communication, RDBMS/SQL, Power BI, Project Management, Tableau, Business Data Interpretation, Interactive Dashboard design, Cross-functional team collaboration

Competent: Docker, Python(Pandas, NumPy), Shell scripting, Data Modeling, Jupyter Notebook

Familiar: Azure, SDLC Documentation, Tableau, SAP, PySpark, Microsoft excel, Sharepoint

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_DhwaniAgrawal

Linux Cluster Monitoring Sytem [GitHub]: Designed and developed a Linux-based resource monitoring system usingn Rocky Linux, Bash scripting, crontab, Docker, and PostgreSQL. Collected CPU, memory, and disk usage data from multiple hosts and stored it in an RDBMS for data analytics and reporting. Implemented automated data collection using shell scripts and scheduled jobs, and containerized the application using Docker to ensure consistent deployment and portability.

Data Analytics Proof of Concept [GitHub]: Developed a data analytics proof of concept by performing data cleaning, transformation, and exploratory analysis on raw datasets using Python with Pandas and NumPy. Structured and prepared datasets to support analytical insights and reporting use cases. Conducted interactive analysis and experimentation using Jupyter Notebook to explore patterns and validate data assumptions. Implemented the project within a Docker-based environment to ensure reproducible workflows and consistent development setups. Managed project code, version control, and collaboration using Git and GitHub.

BSA Fundamentals [GitHub]: Worked on a Business Systems Analysis project focused on turning complex product ideas into clear business requirements and realistic solution plans. Gathered and analyzed requirements to better understand business needs, identify project scope, and separate technical limitations from actual business goals. The project also involved simulated stakeholder discussions where assumptions, dependencies, and clarifications were documented to improve requirement accuracy and avoid scope gaps. Created BRD and SRD-style documentation that clearly explained workflows, system expectations, and business processes in a way that was easy for both technical and non-technical stakeholders to understand.

Data Professional Survey Dashboard (Power BI) [GitHub]: Built an interactive Power BI dashboard using survey data from data professionals around the world to better understand industry trends, salary patterns, programming preferences, and overall job satisfaction. Worked with raw survey data to clean, organize, and visualize meaningful insights through charts, KPIs, gauges, and treemaps. The dashboard helped compare salaries across different roles, analyze country-wise demographics, and identify popular programming languages among professionals. Focused on creating a clear and user-friendly dashboard that supports better understanding of trends in the data industry through interactive and data-driven reporting.

Real time Stock Analytics Dashboard [GitHub]: Developed a stock analytics dashboard in Power BI by integrating financial data from Alpha Vantage using REST APIs. Built end-to-end data pipelines in Power Query (M language) to extract, parse, and transform both JSON and CSV responses, including handling schema inconsistencies and null values. Engineered reusable and parameterized queries to dynamically support multiple stock tickers. Designed advanced DAX measures using CALCULATE, FILTER, and time intelligence functions to compute key financial metrics such as 52-week high/low, market capitalization, and analyst estimates. Created interactive and visually rich dashboards with combined line and column charts for price and volume analysis, along with KPI cards and earnings comparisons. Implemented slicers and dynamic measures to enable user-driven time-based filtering, delivering a scalable and responsive business intelligence solution for financial data analysis.

Credit Limit Optimization Analysis Project [GitHub]: Developed a data-driven credit limit optimization framework to assess customer spending behaviour and evaluate whether assigned credit limits were aligned with actual utilization patterns. The project involved analysing transaction, card, and customer datasets to segment users into low, moderate, and high utilization categories, enabling targeted and behaviour-based credit allocation strategies. Identified significant underutilized credit exposure across the portfolio and proposed optimization opportunities to reduce idle capital, improve lending efficiency, and minimize unnecessary risk. Delivered strategic business recommendations focused on dynamic credit limit adjustment, high-value customer expansion, segment-based credit policies, and smarter capital allocation using Python-based analytics and interactive Power BI dashboards.

Data Processing & Analysis using Spark and Databricks [GitHub]: Worked on a data project using Spark and Databricks where I extracted data from files, APIs, and databases, and transformed it using joins, filters, and aggregations. Learned how to store and optimize data using Parquet and partitioning, and ensured the results matched business requirements. This project helped me understand how to work with large data and turn it into meaningful insights.

Beverage Sales Performance Dashboard (Tableau) [GitHub]: Developed an interactive Tableau dashboard to analyze Coca-Cola sales data and evaluate overall business performance. Designed KPI metrics including total sales, operating profit, profit margin, and identification of the top profit-generating beverage brand. Built visualizations to assess regional performance, track monthly sales trends, and highlight top-performing products. Implemented filters and dashboard actions to enable dynamic user interaction and deeper data exploration. Focused on delivering a clean, structured layout to present insights effectively and support data-driven decision-making.

Highlighted Projects

FormsConnect [GitHub]: Developed a web-based solution to centralize access to organizational forms for a school board. Implemented search, filtering, and metadata tagging to improve usability and reduce support requests. Ensured the application followed accessibility standards and supported secure authentication. Collaborated with stakeholders to gather requirements, conduct testing, and improve the overall user experience.

Professional Experiences

Business System Analyst, Jarvis Consulting (Jan 2026-present): Gather and document functional and non-functional requirements for analytics and infrastructure monitoring solutions while collaborating with stakeholders and development teams to analyze system workflows and translate business needs into technical specifications. Support solution design, documentation, and implementation activities, and assist in system analysis, data validation, and reporting processes to ensure accurate and reliable business insights. Developed Power BI dashboards for e-commerce clients to visualize sales and operational data, enabling data-driven insights and decision-making. Contribute to technical projects involving Linux systems, Python-based analytics, and cloud development environments while maintaining project documentation, including process diagrams, requirements specifications, and solution design artifacts.

Business System Analyst - Finance, MG Motor India Pvt Ltd. (Aug 2020 - Nov 2023): Supported finance operations and enterprise systems for procurement, budgeting, and financial reporting by collaborating with Finance stakeholders and IT teams to translate business requirements into technical solutions. Developed SQL queries for financial reporting, reconciled data between SAP ERP and internal databases, and supported SDLC activities including requirement analysis, UAT, and deployment. Automated reporting workflows using Power BI and advanced Excel (VLOOKUP, PivotTables, Macros), built shell scripts for data refresh and monitoring, and conducted data validation to support operational reporting and internal audits.

Education

Fanshawe College (2024 - 2025), Post Graduate Certificate, Business Information System Architecture - Capstone Project Runner up: FormsConnect - Dean's List 2024 and 2025 - GPA: 3.9/4.0

Birla Vishvakarma Mahavidyalaya (2016-2020), Bachelor of Engineering, Electronics and Communication Engineering - Head of IEEE 2019 - CGPA: 8.6/10.0

Miscellaneous

- Google Data Analytics
- Microsoft Azure Fundamentals (DP-900)
- Volunteer: Sustainability CFT at MG Motor

- Volunteer: Bachhpan NGO (Educating Underprivileged Kids)
